

Professional Experience

Software Engineer and Team Lead

Alphaus Inc.
Tokyo, Japan

October 2024-Present

QA Team Lead (January 2026-Present)

- Engineered a dynamic PR pull-request CI/CD pipeline using CircleCI and GitHub Actions to orchestrate builds, Google Cloud Run, and GKE deployments across cross-repository organization workflows.
- Reduced pipeline execution time by 80% by optimizing VM environment pre-installations to eliminate redundant setup overhead across individual workflow jobs.
- Provisioned and configured self-hosted CircleCI runners on GCP virtual machines, authoring automated replication scripts to support infrastructure scaling and maintenance.
- Extended a custom internal command-line tool written in Go to automate build, deployment, and teardown lifecycles for sandbox test environments.
- Spearheaded a team in building an end-to-end testing framework for live and sandbox endpoints, utilizing GCP Pub/Sub to decouple public runners from internal execution servers deployed on GKE.
- Integrated real-time Slack notifications with automated event triggers to deliver instant build and test status alerts directly to engineering channels.

Platform Team Engineer (October 2025-December 2025)

- Contributed to internal AI agent tooling by engineering automated log retrieval mechanisms to accelerate root-cause analysis for failed test suites.
- Initiated and executed an infrastructure migration from GCP GKE to AWS EKS, translating network topologies, deployment manifests, and VPC configurations between cloud providers.

Professional Services Team Lead (October 2024-September 2025)

- Led an engineering team in building and launching three connected web applications serving over 3,000 active users for customer-facing license issuance, device administration, and real-time fleet telemetry tracking.
- Developed full-stack features using Next.js, NestJS, and Tailwind CSS, deploying services to AWS App Runner for scalable runtime management.
- Served as team lead, scrum master, and acting product owner in an Agile environment, running sprint planning, backlog grooming, and cross-functional feature delivery.

Junior Software Engineer

Alphaus Inc.
Tokyo, Japan

August 2023-September 2024

- Led a team of three engineers to construct a multi-cloud pricing API that aggregated product and rate data across AWS and Azure.
- Designed batch scraping routines to collect cloud pricing data, store raw records in Google BigQuery, and pipeline processed data into Cloud Spanner for real-time API queries.
- Built the backend for a cloud budget management platform using Go, developing RESTful CRUD endpoints and daily batch jobs to monitor spending against threshold alerts.
- Created an automated multi-channel alert system that triggered notifications across Email, Slack, and Microsoft Teams when daily spending exceeded customer thresholds.
- Extended legacy authorization systems by integrating Auth0 social logins to streamline user authentication.
- Developed pixel-perfect user interface components from Figma designs, ensuring complete fidelity to design specifications.
- Implemented a complex filter visualization engine in the frontend to represent nested AND/OR logical hierarchies alongside interactive dropdown elements for CRUD operations.

Education

Bachelor of Science in Computer Engineering
Bohol Island State University (2019-2023)
Magna Cum Laude

Certifications

FinOps Certified Practitioner
The Linux Foundation
